

Q1. Entity-Relationship (ER) Model - Library Reservation System

Entities list their key attributes. Diamonds identify relationships; labels show cardinality.

Mapping to Q3 relational tables

LIBRARY(Library_ID PK, Name, Address) STAFF(Staff_ID PK, Library_ID FK, Name, Role) BOOK(Book_ID PK, Library_ID FK, Title, Status)

MEMBER(Member_ID PK, Name, Contact) RESERVATION(Reservation_ID PK, Member_ID FK, Book_ID FK, Reserved_On, Status)

The two 1:N relationships to RESERVATION produce the logical M:N relationship: MEMBER <-> BOOK.
